PROFILE

Senior AI Engineer with extensive experience designing, building, and deploying large-scale machine learning systems, emphasizing reliability, observability, and business impact Proven track record leading small engineering teams, translating ambiguous business problems into measurable objectives, and collaborating with product, operations, and compliance stakeholders.

SKILLS

Languages: Python, SQL, Bash, TypeScript, Go

Frameworks & Tools: Docker, Kubernetes, GitHub, GitLab CI, MLflow, Weights & Biases, Airflow, SageMaker, FAISS, OpenSearch, Prometheus, Grafana, OpenTelemetry, PyTorch, TensorFlow/Keras, JAX, scikit-learn, XGBoost, LightGBM, Hugging Face ecosystem, OpenAI / Anthropic / Vertex AI, LangChain, LlamaIndex, Spark, Kafka, Redis, PostgreSQL, BigQuery, Snowflake, AWS SageMaker, AWS EKS, AWS Lambda, AWS S3, GCP Vertex AI, GCP GKE, Azure ML

Methodologies: Supervised learning, Unsupervised learning, Self-supervised learning, Transformers, Large Language Models (LLMs), Retrieval-augmented generation (RAG), Ranking / Learning-to-rank, Time series forecasting, A/B testing, Experiment design, Causal inference basics, Evaluation & safety guardrails, Prompt engineering

EXPERIENCE

Senior Machine Learning Engineer

2021 – Present

AI-First Product Company (Simulated)

- Designed end-to-end LLM-backed pipelines, capturing and analyzing large volumes of data to support decision-making, mirroring-data capture requirements.
- Led a small team of ML engineers, acting as escalation point for technical issues and promoting best practices in governance and control.
- Collaborated with product, operations and compliance stakeholders to translate ambiguous business problems into measurable objectives, akin to cross-functional risk-management collaboration.
- Implemented monitoring and observability dashboards (Prometheus, Grafana) to track latency and model performance, providing real-time exposure visibility.
- Established model registry with versioning, promotion gates, and rollback procedures, aligning with governance and controls review processes.

Machine Learning Engineer

2017 – 2021

Data-Driven SaaS Company (Simulated)

- Developed intent classification and ticket routing models, delivering low-latency predictions and supporting operational risk monitoring of customer interactions.
- Built churn prediction and uplift models with calibrated probabilities, enabling targeted risk-based retention strategies and improving campaign ROI by ~25%.
- Partnered with marketing and customer-success teams to design experiments and interpret results, mirroring cross-functional risk assessment collaborations.
- Implemented unsupervised anomaly detection on usage metrics using statistical baselines and autoencoders, deploying dashboards that reduced time-to-detection for critical issues.

Data Scientist / ML Engineer

2015 – 2017

Analytics Consultancy (Simulated)

- Delivered ML solutions for finance and logistics clients, including forecasting and reporting automation, providing data-driven insights for risk-review processes.
- Established coding standards, experiment tracking, and documentation practices across consultancy projects, supporting governance and control consistency.

EDUCATION

M.Sc.

Sim University

B.Sc.

Simulated University

PROJECTS

Enterprise Q&A Assistant (RAG Platform)

- Multi-tenant retrieval-augmented generation system ingesting enterprise documents and providing secure Q&A with hybrid vector + BM25 search.

LLM Fine-Tuning & Evaluation Framework

- Framework for fine-tuning open-source LLMs using LoRA/adapters and evaluating them with automated metrics and human safety audits, reducing false-negative rates by >30%.

Content Ranking & Recommendation System

- Personalized content feed ranking using gradient-boosted trees and transformer models, achieving 6–9% lift in engagement.

Customer Support Automation

- NLP models for intent classification, ticket routing, and response suggestion, reducing ticket handling time by ~20%.

Churn Prediction & Uplift Modeling

- Gradient-boosted churn prediction models with calibrated probabilities and uplift modeling, increasing ROI by ~25%.

Anomaly Detection for Usage Monitoring

- Unsupervised anomaly detection using statistical baselines and autoencoders, with dashboards reducing detection latency.
-
